

	First Start - Unzip and place in any location You like. - Double Click the DXSkinnableSysInfo2.exe - You will be presented to a screen where You have to navigate to the folder the skins are in (by default the same as the Gadget) - Press OK
	- After checking the location You will get the User-Preferences screen - IMPORTANT : Please select a skin You want to start with
	- Fill in other parameters You would need - Due to a limitation in DX You have to press 'OK' and then 'Cancel' to make the window disappear ATTENTION : If You close the gadget at this stage, You will lose all the settings ! Everything will be really saved after restarting the machine with the gadget running. That is due to the fact that DX seems to 'forget' persistent storage when simply closing a gadget that uses this storage. I use it due to the fact that You don't want to find Your mal-passwords in an ini-file nor I want to fiddle with Your registry.
	- Later on You get to these preferences from the gadget by clicking the preferences button (left one in all skins) and choosing 'User Preferences' - You get the standard DesktopX preferences obviously by choosing them by the same menu

Skinning :

- To get an idea how I did this graphic-wise please refer to any skin in the folder, it is dead-easy to do. Keep in mind that all the graphics have the same file-names throughout the whole system, that is all You have to take care of.
- There are parameters for the skins stored in INI-Format, which also can be set by a Window from the menu
- If You want to do a new skin, best way to do that is copying a skin-folder and then change the graphics and (important !) the Skins.ini in that folder.
- First step would be change the skin-name in the ini.
- If You want to use the GUI to go on changing, copy the content of the INI to the main INI resided in the main folder with the exe.
- Chose the skin You have just created and then got to it's settings via the menu.
- After You are finished with the changes press okay (You will be able to see the changes 'live' by doing this after every change). After everything is to Your liking press OK one last time and then 'Cancel'.
- Now go to the main INI again and copy the passage for the skin You just created. Go to the folder of the skin again and paste into the ini of the skin. The last step is important if You want to upload the just created skin for other people to use. They will be able to import Your creation then and have all settings right in the main INI also.
